Involvement of ABCA1 and ABCG1 in the cholesterol efflux pathway from macrophages. Apolipoprotein A-I and apolipoprotein A-II are major apolipoproteins of high-density lipoproteins (HDL). These molecules are required for the rapid removal of excess cholesterol from peripheral cells by regulating the cholesterol efflux pathway. Little is known about the cellular pathways of cholesterol uptake and efflux. Here, we investigated the role of ATP-binding cassette (ABC) transporters in the regulation of intracellular cholesterol levels in mouse macrophages, RAW 264.7, and human THP-1 cells. Both the ABCA1 and ABCG1 transporters were expressed and demonstrated high activity in macrophages. Consistent with the high activity of ABC transporters, we found that macrophages have the ability to efflux cholesterol to a high extent (39%). The expression of ABCA1 and ABCG1 was significantly reduced by treatment with 5% low-density lipoprotein. Following siRNA treatment, the expression of ABCA1 and ABCG1 decreased by 55 and 56%, respectively. Treatment with recombinant apolipoprotein A-I and apolipoprotein A-II increased cholesterol efflux by 67 and 53%, respectively. Furthermore, the cholesterol efflux was increased by approximately 60% following preincubation of cells with 2 microg/ml of recombinant apolipoprotein A-I and A-II. Jaundice in the newborn. It can sometimes also occur in the newborn and usually resolves spontaneously within the first few weeks of life. The aetiology of neonatal hyperbilirubinemia is often related to immature hepatic excretory system, and the
