OBJ/STEP/LT2 AutoCAD imports and exports data to a number of different file formats (including both Autodesk's own format, STEP, and the older ASCII-based file format LT2), and can read and write these file formats through the DCX format. It can also import and export a number of file formats not part of the DCX format, including: AutoCAD.DXF and CADET.DCR DXF DXF is the native format for AutoCAD and the drawing exchange format (DXF). Drawing Exchange Format (DXF) is the exchange format for the AutoCAD 2D and 3D products. All Autodesk applications, except for AutoCAD LT, support the DXF file format. Autodesk now plans to replace the DXF format with another format. CADET CADET is the drawing exchange format for AutoCAD LT. Autodesk started the Cadet Exchange Format (CDEF) initiative, to replace DXF with a new drawing exchange format called CADET. As of October 2010, CADET is only available as a library, not a replacement for DXF. AutoCAD LT uses CADET in order to export files to AutoCAD LT or other applications that support this format. CADET is also used by the default save method for drawing templates, not to be confused with drawing exchange format (DXF). Autodesk Exchange Apps Autodesk Exchange Apps are a way to create applications for specific fields within AutoCAD, including: AutoCAD Architecture AutoCAD Electrical AutoCAD Civil 3D Exchange Apps are created using either the ObjectARX or Visual LISP programming language. They can include both AutoLISP and Visual LISP code. They run within the application itself, rather than a separate, standalone application. This gives them access to the AutoCAD engine, as well as standard AutoCAD commands. Structure Wrapping Structure wrapping is the term used to describe a process that moves the selected objects in a drawing, or creates a new drawing, to a new location based on information stored within the drawing itself. The shop where I bought it asked if I wanted an electric front shock, and I said "Yes". But they didn't make a kickstand for it, so I had to wait. Well it was already two weeks ago, so I thought I should mention it. I checked the web and got three candidates: Unfortunately they all appear to be made of metal. If they weren't, I wouldn't have a problem, but I don't know if they are so I decided to be careful. Also, the bottom of each frame is flat, so I'll have to put a kickstand on the bottom to keep the bike in position while charging. I thought about it again and decided to go for the "strongest" one. I think it'll be enough. The sides of the frame are flat. And if it doesn't work well, I can easily take it off and put the other one on. But if it does, I'll be happy. I also don't want to get two flat frames. I want to be sure. Don't worry, you won't have to read any tedious descriptions of the frame. Because I already have it. I've bought it. And I'll try it as soon as I can. I just have to find a shop that'll put it on my bike for me. As long as they don't put too much weight on the handlebars, it'll be fine. I didn't think there was anything funny about this. Why not? Because I had another obstacle to go through. I had to take care of my phone. As I said before, I can't take it with me, so I had to find a solution. That's what I did. I bought a bike-friendly backpack with a USB port. I don't want to carry my phone with me all the time. I have enough hassle carrying it around, so I figured I'd just buy a more lightweight one. But I still need
