It was named after Presque Isle Bay to the west and the Presque Isle River to the east. The bridge over the river was built between 1910 and 1913 and replaced an earlier ferry service that had been in service since 1860. The present bridge is also referred to as the "Erie Bridge", and is considered to be the first massive concrete bridge in the United States. In 1963, the eastern approach of the bridge, across the Presque Isle River from Erie, was the site of the now famous Eric Erickson photo depicting a collision between a Chevrolet Corvette and a T-bucket truck. The Presque Isle Toll Bridge also existed in the area, connecting the east and west sides of

Back in June, Apple launched its new iPad tablet, the iPad Mini and a Retina-display-enabled 4-in. display iPad, the iPad 3. Things are hot and heavy in the small tablet space, and in December, Apple will roll out its next wave of tablets: the new iPad 4, and the new Retina display-equipped iPad Mini, for a total of two new smaller iPad tablets in the lineup. The original 9.7-in. iPad is a giant beast compared to the 7.85-in. iPad Mini and 4-in. iPad 3. The new Mini is a lot smaller, and the new 3-in. screen iPad is a whole new level down in size, but its shrinking footprint means smaller guts and more of a crowd. Apple is only sticking with current chip supplier A7, though it's unclear if the company will ship the first-generation (A6) iPad Mini with Retina display. Earlier this year, we had already seen pieces of information that indicated Apple would have a version of the iPad Mini with a Retina display in production in October. For instance, Tom's Guide reported that Apple is expected to have finalized the new iPad mini with Retina display, though it also stated that the device will not be in stores in December, because Apple is waiting for manufacturing parts to be ready. As evident by the company's iPad Mini and iPad 3 event on March 9, Apple unveiled the iPad Mini and iPad 3 last fall. The company is yet to show the next iteration of the iPad line, which will be unveiled in a media event on March 9. For a variety of applications, it is desirable to store and deliver relatively large amounts of therapeutic

.This invention relates to methods for manufacturing flexible containers from thermoplastic materials by extruding a parison of molten material, stretching the parison to a size which is smaller than its ultimate size, while simultaneously transporting the parison longitudinally within a mold comprising an endless belt and a stripper bar. Apparatus used for the manufacture of flexible containers for food and beverage products are well known in the art. For example, U.S. Pat. Nos. 4,630,517 and 5,189,885 which are incorporated herein by reference, disclose such apparatus, which includes a pair of horizontally positioned molds which are transported along an endless groove in the upper surface of an endless belt. The molds are connected to one another by a plurality of resilient latches. It is desirable to be able to provide for the extrusion of thicker gauge containers, and in particular, for the extrusion of containers that are suitable for food and beverage products. However, it is known that as containers are extruded of a greater wall thickness, the change in the extrusion process results in an inconsistent extrusion process. Moreover, extruding thicker containers is often more difficult and/or requires more process time to extrude, which can add to manufacturing costs. Accordingly, although efforts have been made to manufacture food and beverage containers from thicker material, a need still exists in the art for a method which will result in the extrusion of consistent high gauge food and beverage containers, using thicker material, and can be used to produce a wide variety of shapes and sizes of food and beverage containers. Methods for extruding containers from thicker materials have resulted in the use of reduced stretch ratios, and/or more complicated extrusion molds. In view of the increased costs associated with these extrusion processes, as well as the inherent difficulties of these molds, the manufacture of food and beverage containers from thinner material are favored. Accordingly, it is an object of the present invention to provide a method of manufacture for extruding a parison of molten material into a container, which can be used to manufacture containers from a wide range of material thicknesses, and which increases the versatility of the extrusion process. Another object of the present invention is to provide a method for the manufacture of containers, which can be used with a variety of extrusion mold configurations, and which reduces manufacturing costs of such containers. Another object of the present invention is to provide a method of the type described above, which reduces the time required to manufacture
