8B, to the base of the SAW resonator 8. At this time, a low-frequency oscillation is generated by the oscillation circuit 14. When the oscillation frequency of the oscillation circuit 14 is higher than the frequency of the low-frequency oscillation, the high-frequency oscillation having the frequency higher than the low-frequency oscillation is obtained by applying the high-frequency oscillation from the oscillation circuit 14 to the base of the SAW resonator 8. Consequently, when the harmonic wave of the low-frequency oscillation is suppressed, the base voltage of the SAW resonator 8 is made low and the output of the low-frequency oscillation is reduced. At this time, a current I0 having a value corresponding to the base voltage of the SAW resonator 8 is applied to the load coil 15. The magnetism caused by the alternating current Is and the magnetic flux generated by the current I0 can be cancelled to each other. Moreover, the impedance value of the load coil 15 is set large. As a result, the magnetic field generated by the harmonic wave caused by the low-frequency oscillation is reduced so as to be more than the magnetic field due to the alternating current I0, and hence the harmonic wave can be suppressed. On the other hand, according to the SAW resonator, there is no temperature compensation. Therefore, in the SAW resonator, the harmonic wave is generated as a result of the operation of the voltage-controlled oscillation circuit, and in the process where a harmonic wave is added to the low-frequency oscillation, it is difficult to suppress the harmonic wave. On the contrary, according to the magnetic resonance device having the same structure as that of the present invention, it is possible to suppress the harmonic wave by the magnetism caused by the alternating current Is. Accordingly, in the present invention, it is possible to realize a harmonic wave suppression function by using a bias magnetic field, which is generated by the application of the alternating current Is, for the SAW resonator. Moreover, in accordance with the SAW resonator of the present invention, it is possible to obtain the low-frequency oscillation as a result of the operation of the oscillation circuit. Accordingly, in accordance with the present invention, it is possible to acquire the signal as the output by the direct conversion system. Furthermore, in accordance with the SAW resonator of the present invention, it is possible to
