FLUIDSIM 5.0 - FluidSim 5.0 The latest version can be downloaded from the. The present invention pertains to digital data communications systems and pertains particularly to a method and apparatus of detecting a failure in a data communications system. Communication over telephone lines and the like has been accomplished for many years using analog modems with each user having an analog modem which transmits and receives by converting the analog signals to and from digital signals in the modem. Each user also has an analog modem which can be used to receive the digital signals by converting the digital signals to analog signals for speech processing. Such analog modems can use standard analog modems for analog transmission and reception. Such analog modems do not utilize an internal buffer between them to store digital data sent by or received by the other user. Digital modems have been developed for directly transmitting and receiving digital information over such telephone lines and the like. Such modems were developed with the concept that more digital information can be transmitted and received over telephone lines than can be transmitted and received using analog modems. Such digital modems should be compatible with analog modems so that both types of
