Parts of this software were originally developed by Nathan Kuhn and Sven Vach for the Linux Kernel. Comments and bugs should be sent to me at alain@regnier.com History ----- v1.0.0: First released version for Unix platforms in 2008 v1.1.2: Porting for Win95 platforms in 2008 v1.1.4: Porting for Windows 2000 platforms in 2008 v1.1.5: Fix errors when the directory has multiple volumes in volumes mount point case in 2008. v1.1.7: Add support for multiple unmounts on directories in 2009 v

===== The SizeReporter project is here to help you keeping track of disk usage on disk drives (other partitions will not be reported here). First, the tool will create an.xml file in the current directory containing all entries. The tool then scan each subdirectory, and will report the entries in this directory and below. Normally, the tool will scan each directory and files in the path until it reaches the root path (where the application is) and it will report the directory and files size in the same directory. If the path is empty, the tool will report the current directory size. If the output file path is empty, the tool will report the current directory size. The tool will not report any status concerning the current directory or the root directory itself. If two directories are the same size, the application will report a 'family' of directories and will not show one of them. The report will contain only directory names and sizes as numbers. The tool will resolve the size of directories and will not report any information regarding the actual path of the directory (example "C:\temp\dir.txt" or "C:\temp\dirs\dir1.txt"). The tool will report a size of 0 for any directory that is not located at the root directory. If a file is not modified since the last report (exists time is older than 24 hours), the application will report the size of the file with no directory. This might be useful when tracking the size of a backup file for example. When the root directory will be parsed for the first time, the application will recreate the root directory and the.xml file. The depth of reports and the time window to be reported can be configured through the configuration file. The tool will recurse the directories and files until they reach their maximum size. Here is an example of the sizes of directories in the current directory: In the name of each directory a family of directories are reported (will not be reported if empty) and the total size of the family (empty family) is also reported. When the family is not empty, the total size of the family will be reported as well as the names of the family members. The report will contain entries for the following directories: 1. root directory 2. "d:\myDrive\MyFolder" 3. "d:\myDrive b7e8fdf5c8

=====
The SizeReporter application is designed to retrieve disk space and assign it to files and folders. To do so, it uses a hierarchy of directories and files, a custom Indexing of these files and folders in order to find quickly the right file for disk space consumption. A tree of directories is used to organize your files, this tree is used to find quickly the root folder of files. The hierarchy can be modified, but the different depths must be preserved. The user can define a maximum number of levels to be included in the tree for reporting, it can be changed with the /maxdepth parameter. By default it reports all the folders and files (deeper than the level defined in /maxdepth) in the output files (csv / tsv), but this can be changed with the /onlyFoldersToReport parameter. Binary Version Information: ===== This is the binary software package, with the files ready to be packed by the installer. Customizable Parameters:
===== You can change the level of detail of the report by choosing one of the following parameters: /onlyFoldersToReport If you choose this option, all the folders are reported as folders, even if they are not. /maxDepth Set this to a value in order to report a maximum depth. Default value: 2 /maxDepth parameter is only supported if the /onlyFoldersToReport option is chosen. /ref If you choose this option the output will contain the absolute path to each file so the user can easily change or process the output without any files manipulation. /ref parameter is only supported if the /onlyFoldersToReport option is chosen. Known bugs: ===== * The /onlyFoldersToReport parameter can make the tool crash if the number of files to report is too high. This can be avoided by canceling the run before the fatal error is raised. * The /maxDepth parameter will only report folders that are not directly inside another folder. * A security alert when running on Windows 2000 or Windows 2003. The SizeReporter tool, and the documentation, is licensed under the GNU General Public License version 2.0. If you use this application, please add a notice like this to your application: Welcome to the QBSnippets Filesystem Scanner - Copyright 2012 - Christian Lapuente. The documentation included

What's New in the SizeReporter?

----- The SizeReporter tool parses a directory tree, like an explorer, and creates a summary of the file and directory structure. It uses heuristics to detect file sizes using patterns such as: - the file name - the size of the file - the number of sub folders (level) - the path - the path depth (number of..) - the directory name - the directory depth (number of..) ... This heuristics can be refined, added, and disabled at your desire. The tool also produce: - a percentage of the file size - a ratio of the physical size / free space The report can be filtered by the type of file and the size range. You can also configure a result threshold. The results are sent to a text file in tab delimited format. Example Run: ----- This run is done on a Windows Vista partition with the following configuration: directory: 'C:' depth: 5 (depth is the number of.. that you enter in the path) The.csv file is available here: Example run: ----- This run is done on a Windows 7 partition with the following configuration: directory: 'C:' depth: 8 (depth is the number of.. that you enter in the path) The.csv file is available here: I don't understand why 'Move File' would remove the files from the old path, if they are unlinked (because I wouldn't expect them to be unlinked by using MoveFile). If anyone is willing to give some feedback on this idea, please do so! Thanks in advance Romain It seems that only the 4 minis releases are supported. Although there's a 'Beta' tag on the page it seems that only full versions are released (Hi Romain, We tried to execute the PC MD5 file before finalizing the release. During the installation, the application warns that the desktop shortcut MD5 file on disk is invalid and attempts to download a new version if the file is modified. Hi Romain, Due to the nature of the file application,

System Requirements:

iPad Pro 9.7 MacBook Pro with Retina Display (13-inch, Late 2013) MacBook Air with Retina Display (13-inch, Early 2015) iPad Air (2nd and 3rd generation) iPad mini (1st, 2nd, and 3rd generation) iPhone 5s or later Mac OS X 10.9 or later At least 6 GB of RAM 12 GB of available storage Why you should be excited: One of the most common questions
