Anytone At-5555 V6 Software 22l

There is another streaming app for the AnyTone called AnyTone Cloud. Although not a part of the Bridgecom integration suite, its free to use and its simple to install, you can pair it with your radios via QR code if needed. On the downside, it doesnt work for VHF/UHF modes, but fortunately, they have easy ways to reprogram it to work for those modes through their software. This means you can try out the DMR mode with the AnyTone by streaming to the Anytone using an open source QR code decoder. If you find QRP mode isnt enough, you can always add an IrDi adapter that connects to the bridge port, to ultimately build a full IRIG router. After a little trial & error, I found the most reliable DMR mode was the Normal mode that I set on my UA416. This means we can all see the commands being transmitted! This is a huge help in training, especially when the CRI can vary as much as 10% from the Tx. OTOH, it also means you cannot program stations via single button presses with the UA416 because its more of a pre-set mode, rather than a true DMR mode. If you are looking for true DMR, wait a few months until SDRplay comes out with the DMR support. On the subject of timing, my UA416 is set to UTC-GMT, with an offset of -7, while my Anytone is set to a local time offset of 3 hours. Be sure to set your SDRplay to the correct time zone before hooking them up if your radios are local. One of the things that has really sold me on the AnyTone over a traditional X.10 SDR is that it includes 7 different encoding modes, which generally offer more bandwidth than WSPR. While I do love WSPR, I also love DMR so the 7-mode Anytone 578 has put me on a solid DMR adventure. The following modes are supported by the Anytone:

Anytone At-5555 V6 Software 22l

Same problems and same fix. When you plug in your AnyTone radio, it finds the firmware updater and displays the message shown above. I was able to download & install the V2.02 firmware update, however after a reboot, Windows did not re-recognize the radio until I selected it in the radio manager. After that I was able to use it just like the previous firmware versions. After installing the latest AnyTone CPS software on my desktop, I tried again to load the firmware updater. The same message appeared as above, but the second time I selected my radio, the firmware updater and radio worked fine. (whew!) I wanted to see if the new update would at least fix my problems

with the 30 digital programs not being recognized correctly. Well, when I try to run that program, its still only recognized if the last one is done loading. Not sure if this is a proper fix or simply just a band-aid, but it works fine and as long as no one else at the station is using the 30 digital programs I dont care. Below weve the download links to the V1 and V2.01 software for the very popular Anytone AT-6666. Remember youll need a dedicated programming cable unless you use the standard AT-5555 cable and plug direct to the board. The latter option is the poorest in my opinion as the board gets super hot. Make sure to use the right software to your model of radio. Now my AnyTone radio will be facing doom as I leave it on the balcony, trust me! I know from experience, as I find out when its

time to fix things like any other radio, that its usually stuck until I get to the place in my life thats available to take it with me. If youre like me, there comes a time in your life when you need to take control of your security, just like any Jeep Cherokee, then youre reading the right blogpost. This time, Ive got a second AnyTone 578 for sale. Bought it used off eBay for a reasonable amount of money, and it includes the router, antenna & programming cables from the original sale. If youre interested and already have an AT-5555, I recommend a touch the radios IP address in your router control panel and then scan for new updates. Keep in mind that theres two files (AT-5555 and AT-6666) available. The one im selling is the AT-5555 version of the radio, so we dont need the

AT-6666 one. 5ec8ef588b
