Agreed. The interface is more powerful and creates more powerful results than it has in the past. It does get a little long-winded—which is to be expected of any product, but now it also has a handful of what Adobe calls "3D features", which means 3D lens flares as well. No thanks, Adobe. Creativity is one of the hardest things to explain. Both printing or painting is simple in that you can point to the canvas and say, "That's how it's going to look." But the idea of bringing this power to the masses is not straightforward. Simons began his own new venture SIT, which was formed along with Tofel and "drew on the tools of web development" and used "the web to maximize the effectiveness of the arts". Because this community knows better than most how important software as accessible and intuitive as Photoshop was and have been for so many, the BECR took on the challenge of making the software publicly available. For the community, it was a no-brainer. For Adobe, it was a bold new experiment. Emscripten allowed for fast porting of the speed to execute pieces of code, but it's not just that. It also allows for it to run everywhere, including the web, which is where the BECR is headed. Though Google made some major changes to Emscripten in their recent releases, the JavaScript to Emscripten translation needed verifying and testing to ensure the safety of the BECR users. The BECR has been given the ability to export a suitable format for the web. Once Google recognized the value of porting the **software** to the **web**, their **device manufacturer partners** started using android-webview. The browser also has many advantages, including being able to run in the background so a user can use the device like their everyday system. However, before the computer could even run the software the browser needed to install, and that was the part that required a lot of testing. e3d0a04c9c
