Together with SpeedGrade, Photoshop is a complete video-editing workflow you can access from the Mac. Tooloverflow works much like they do in Photoshop, and the Integrated Editor is accessible from the browser. (Same), but we had to build our own memory card readers, custom printers, and even initial "photo masters" (you had to make your own masters because the low-resolution printing for the original PlayStation wasn't built in!) and press-scan imager chips. The same two of us have reviewed hundreds of application updates and hundreds of operating system updates, and numerous hardware reviews and product reviews for PCMag. We've been huge fans of how Photoshop has evolved in the right way; every step forward was needed to lead to the next step forward. Photoshop went 4D artists, then went to the web and then to mobile and tablet devices. Short of developing your own hardware and co-opting every developer into a constant feedback loop, you just can't know what the future holds for Photoshop. One thing is for certain, you can count on architectural inconsistencies and occasional failures to roll out on a 6-month design cycle, and the good news is that "fixing it" is as simple as updating it. The interaction between Photoshop and the operating system has actually changed so much, however, that it makes continuing to use older versions of Photoshop *impossible* -- even *if* you happened to have it installed on your machine. We've written some pretty scathing reviews in the past, and we'll continue to cover Photoshop, and any new features as part of our Photoshop portfolio until it's no longer worthwhile to write features ("new Photoshop" in a sentence!)
